

Delivering Visual Intelligence Across Platforms & Across your Enterprise

Enterprise Standard Business Intelligence

Data Volume

Your data is getting more complex

You want to enable your entire team to create reports

Data Skill Level

Data Complexity VS Data Skill Level

Complexity vs. Skill

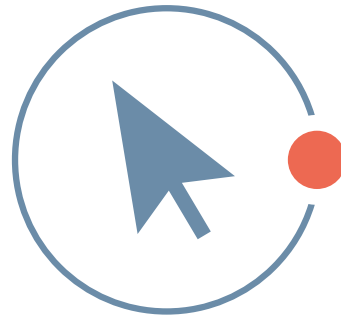

You have a **CHALLENGE.**

DaphnaBI addresses today's challenges on three levels: Point-and-Click DIY to empower all team members, SQL for Developers and Power Users, and citql ('sightQL') to make Developers and Power Users more productive.

The Solution

Point and Click

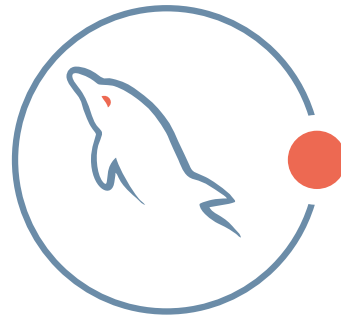

DaphnaBI allows users of all skill levels to create highly interactive dashboards, reports, charts, and maps using an intuitive, point-and-click UI.

DaphnaBI allows Developers and Power Users to create highly interactive dashboards, reports, charts, and maps via a SQL with a feature-rich SQL editor

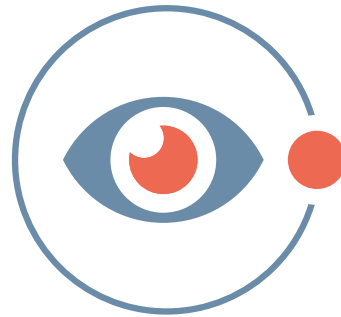

SQL

citql

DaphnaBI makes your Developer's SQL more productive with citql ("sightQL"). citql are SQL Tags that add functions & interactivity to your SQL without obscuring your data. DaphnaBI includes over 20 citql tags for adding interactivity quickly and easily, as well as functions for transforming SQL into maps and much more.

Enterprise Standard Business Intelligence

DIY should not mean having to expose even a single row of data to those who do not need or shouldn't be privy to it. That is why DaphnaBI employs Enterprise Reporting hierarchies & roles. Your Admins can decide which Developers/Power Users get to see what, as well as create views or include, discard, or weigh data.
